1 Introduction

Competent politicians are key for government and democracy to function well. In most democracies, political parties select the candidates who can run for o¢ ce. Parties' decision on which candidates to let run under their banner is therefore of fundamental importance. When they select candidates, parties have to worry not only about the competence of candidates but also about incentives, about their candidates' motivation to engage with voters and work hard for their party's electoral success.

Under closed-list proportional representation (PR),¹ the legislative seats a party wins are allocated to its candidates following the order of its electoral list. In this context, the parties' selection decisions become even more complex as they need not only decide which candidates to let run under their banner, but also how to rank them on their electoral list. As shown in Crutzen, Flamand, and Sahuguet (2020), each position on the list generates distinct incentives for candidates.

In this paper, we develop a formal model to analyze the conditions under which parties rank their candidates in decreasing order of competence. This orderreas ar559-23603(c)100(t)8(s)-420t2f7(l)6(-21.669Td[(p)12(a)110(c)9(o)a6(i)6(t)8(i)9(a)6)9(s2o)-335(r)120tes.t camas371(e31(a)1(e))11(d)-394(S)182(N10(m)11(n)12(e)9(r)9(i)6(a)10(nn6(d)12(a(e)1060)10())8110(a)1(e) pa i8ndidates td dngs248(v)113 fnlchl9(i)z0(n)3c11(e)9(i)6(r)-367(c)4(a)s2(e)-333a-359 ksii8gislativelys9

to adopt a ranking that mirrors these incentives when their candidates dizer in competence.

This ...nding does not change when candidates are also driven by ideology, as the impact of ideology on exort is independent of the position on the list. That ideology has no impact on the way parties rank their candidates to maximize electoral success also has the following, surprising additional exect. Ideological polarization only impacts candidates' objective function via the payox linked to ideology. As ideology impact on incentives does not depend on the rank on the party list, changes in the ideological polarization do not in tuence how parties rank candidates.

Post-electoral high o¢ ces (typically linked to the control of the executive) o¤er a possible

2 Related Literature

Candidate ranking strategies are not well understood in closed-list proportional representation systems, especially when both incentive and competence considerations play a role. Our paper thus adds to a small but growing literature, both empirical and theoretical, that

position on the list and an individual payox – linked to post-electoral high ox ces – that varies according to the position on the list. Finally, we introduce media weights in the party output production function. These weights are decreasing with rank. Tresch (2009); Van Aelst et al. (2010); or Vos and Van Aelst (2018) report evidence that corroborates this assumption.

Buisseret et al. (2019) also propose a formal model of list composition and then test their predictions on Swedish municipal election data. Their model focuses on competence and leaves aside incentive exects. Candidates dixer in competence and are passive participants in the electoral contest.⁴ The outcome of the election is determined by a complex calculus of voting. As in our model, parties that want to maximize their electoral success place their best candidates on marginal ranks. Yet, this is not due to incentive reasons, but to the fact that "a voter recognizes that her vote is likely to be inconsequential for the election prospects of candidates located within safe ranks" (Buisseret et al., 2019, p. 2). If parties also care about electing their best candidates and voters "recognize that high-quality leaders are the primary drivers of good policy outcomes" (p. 14), then placing the best candidates at the top of the list can be optimal.

Our theoretical predictions also help re...ne the empirical studies in the ...eld. Indeed, we are not aware of any theoretical prediction on the exect of the media and the importance of post-electoral high o¢ ces on candidates' ranking strategies of parties. For example, some contributions focus on the role of gender (Baltrunaite, Bello, Casarico and Profeta, 2014; Esteve-Volart and Bagues, 2012; Besley, Folke, Persson and Rickne, 2017). Others show that party loyalty matters, as Galasso and Nannicini (2015) do for the 2015 Italian elections (and especially for safe seats). Matakos, Savolainen, Troumpounis, Tukiainen and Xefteris

and Svitakova and Soltes (2020), for the Czech republic, ...nd that candidate competence (as measured by earnings score or years of education) correlates positively with list rank, implying that parties put their best candidates at the top of their list. But in none of these works the role of media coverage and post-electoral job opportunities are taken into explicit consideration.

3 The model

parameter of the distribution is determined in a generalized Tullock contest among the parties based on the ratios of parties' electoral outputs. Party j's probability of winning each seat follows a binomial distribution described by each seat's winning probability p: ⁷

where is a return to scale parameter, and **j** denotes the other party. Values of lower than make the allocation of prizes among teams more noisy and less responsive to parties' outputs. Lower values of also make the objective functions of team members more concave; thus plays an important role to ensure equilibrium existence.

We assume that the probabilities of winning seats are independent. Thus, the probability of party j's winning k seats is given by:

$$extbf{\emph{P}}_j^k \quad extbf{\emph{C}}_k^n extbf{\emph{p}}_j^k \qquad extbf{\emph{p}}_j^{n-k}$$
 :

Payo xs. On the cost side, we already mentioned that candidate i's individual e^x ort cost is k e_{mj} $\frac{1}{2}c_{mj}e_{mj}^2$. There is a bene...t to be elected to the legislature, equal to v. Candidate in position e on the list gets elected if the party wins at least e seats, which happens with probability e^n e.

Each candidate also enjoys a purely ideological bene...t W when their party wins a majority of legislative seats, as it then controls the executive and can implement its platform. The party wins such a majority of k^{maj} $\frac{n+1}{2}$ seats with probability $n_{k=kmaj}^{n} P_{i}^{k}$.

When the party wins the election, the top candidates of each party may gain access to an executive position or some other high o¢ ce, such as the position of House Speaker. We assume that there are \mathbf{k}^C $\frac{n+1}{2}$ such executive positions and high o¢ ces and that these positions go to the candidates ranked in the top \mathbf{k}^C slots on the party list, with the candidate in position $\mathbf{m} < \mathbf{k}^C$ receiving the o¢ ce with \mathbf{m}^{th} highest value. Thus, these o¢ ces each have value \mathbf{w}_m and \mathbf{w}_1 \mathbf{w}_2 :: $\mathbf{w}_k \mathbf{c}$ $\mathbf{w}_k \mathbf{c}_{+1}$::: \mathbf{w}_n : Let \mathbf{W}_m \mathbf{W} \mathbf{w}_m .

⁷Our modelling strategy allows for the inclusion of a weight > 1 multiplying party j's output. These weights introduce a bias in the contest as one party is advantaged, possibly due to voters' ideology leaning towards that party. The probability p_j then becomes $p_j = \frac{(E_j)}{(E_j) + (E_j)}$. For the sake of expositional clarity, we do not add these weights in what follows.

Candidate **mj** in position **m** on party **j**'s list has thus the following bene...t function:

$$\boldsymbol{B}_{mj}$$
 $\boldsymbol{V} \times \boldsymbol{P}_{j}^{k}$ $\boldsymbol{W}_{m} \times \boldsymbol{P}_{j}^{k}$

Timing

The timing of the game is as follows.

- 1- Nomination stage: Party leadership designs the list of candidates.
- 2- Campaign stage: Given party lists, candidates exert exort.
- 3- Election stage: Given perceived party outputs, seats are allocated to parties.

4 Solving the model

4.1 Campaign stage: equilibrium exorts

In this subsection, we solve for the equilibrium of the campaign stage in which candidates choose exort given the party lists and their position on their party list. Candidates exert exort to increase the probability they get elected (simply to parliament or to parliament and a higher o¢ ce) through an increase in p_j . Candidate in position m in party j chooses exort e_{m_j} to maximize:

$$egin{aligned} m{B}_{mj} & m{K}_{mj} & m{e}_{mj} \\ m{X} & m{Y}^k & m{p}_j & m{W}_m & m{Y}^k & m{p}_j & -m{c}_{mj} & m{e}_{mj} \end{aligned}^2 :$$

Let $\mathbf{M}_{j}^{m} \quad \mathbf{m} \mathbf{C}_{m}^{n} \mathbf{p}_{j}^{m} \qquad \mathbf{p}_{j}^{n-m+1}$ and $\mathbf{M}_{j}^{maj} \quad \mathbf{k}^{maj} \mathbf{C}_{kmaj}^{n} \mathbf{p}_{j}^{kmaj} \qquad \mathbf{p}_{j}^{n-kmaj+1}$: We then have:

Proposition 1. In the Nash equilibrium of the game, candidate in position **m** on the list of

party \boldsymbol{j} exerts $e^{\boldsymbol{z}}$ ort $\boldsymbol{e}_{m_i}^*$ and party \boldsymbol{j} 's electoral output is given by \boldsymbol{E}_i^* , where:

$$e_{mj}^* = \frac{a_m}{c_{mj} E_j^*} M_j^m V M_j^{maj} W_m$$
, (1)

$$\mathbf{E}_{mj}^{*} \qquad \mathbf{E}_{m}^{*} \quad \mathbf{M}_{j}^{m} \quad \mathbf{V} \qquad \mathbf{M}_{j}^{maj} \quad \mathbf{W}_{m} , \qquad (1)$$

$$\mathbf{E}_{j}^{*} \qquad \mathbf{E}_{m}^{*} \qquad \mathbf{A}_{j}^{m} \quad \mathbf{V} \qquad \mathbf{M}_{j}^{maj} \quad \mathbf{W}_{m} : \qquad (2)$$

We characterize the equilibrium by taking the ..rst-order conditions of candidates' maximization problems. In the appendix, we also check the second-order conditions and derive a su¢ cient condition under which the solution of the system of ..rst-order conditions indeed maximizes candidates' expected payox.

If all candidates were of equal competence, the distribution of equilibrium exorts would follow the distribution of \pmb{a}_m^2 $\pmb{M}_j^m \pmb{V}$ $\pmb{M}_j^{maj} \pmb{W}_m$. As the distribution of binomial coe¢ cients is bell-shaped, the distribution of exort inherits similar features (see Crutzen et al., 2020 for more details on the case with no media exect and W_m). When candidates are heterogeneous in competence, equilibrium exorts also depend on how competence maps into parties' candidate ranking strategy.

4.2 Nomination stage

Given the above optimal choices of candidates, parties order candidates on their list to maximize their electoral success. In doing so, parties take into account the equilibrium exorts de...ned in Eq.(2) and (3) as well as $\underline{\text{th}}$ e associated probabilities of winning seats. the weights $\mathbf{\textit{M}}_{j}^{m}$ and $\mathbf{\textit{M}}_{j}^{maj}$, which are themselves a function of $\mathbf{\textit{p}}_{j}$. The party thus assigns candidates with marginal costs of exort \emph{c}_{mj} to a position in which the incentive to exert exort is proportional to $_j^m$ ${\it p}_j$ ${\it a}_m^2$ ${\it M}_j^m$ ${\it V}$ ${\it M}_j^{m\, aj}$ ${\it W}_m$. To maximize party output, the list should assign the highest quality candidates to the position with the highest value of m, the second highest quality candidate to the the position with the second highest value of j^m , and so on and so forth.

To maximize their party's electoral success, the leadership assigns the most competent candidate to the position with the highest value of M_j^m : As the distribution of weights M_j^m is hump-shaped and single-peaked, the distribution of competence across ranks needs to replicate this hump-shape, with the most competent candidate in position np_j , if we ignore integer constraints. Indeed, if the party expects to win np_j seats, then the marginal bene...t of exerting exact is highest for the candidate who is exactly at np_j . More generally, other candidates are allocated in positions around the peak in decreasing order of competence following the values of M_j^m . We thus have:

Proposition 3.

When candidates only care about get-

Proposition 4. The ideological bene...t **W** has no exect on parties' optimal list strategies.

An increase in ideological motivation, caused for example by an increase in the polarization of party platforms, makes the stakes of the election higher. Intuition would then suggest that parties have stronger incentives to put their best candidates on top of the list. This intuition turns out to be incorrect. The bene…t \boldsymbol{W} impacts party output through $\boldsymbol{M}_j^{\text{maj}} \boldsymbol{W}$. Therefore, as $\boldsymbol{M}_j^{\text{maj}}$ is the same for all candidates, a change in \boldsymbol{W} does not a ect the ranking of the $\boldsymbol{M}_j^{\text{maj}} \boldsymbol{V}$, and thus the optimal list order does not depend on \boldsymbol{W} . The recent

candidate at the top of the list, the second largest boost to the second candidate on the

5.4 Party's popularity and list order

In most countries relying on proportional representation, a wide array of parties compete for seats. Some of them are major parties looking to win control of or at least participate in government, while other smaller parties are trying to push their agenda and get a few seats without a real chance to control the executive. Does the party's popularity and expected seat share in tuence the way they organize their list and rank their candidates? In the model, p_j corresponds to party j's popularity. Of course, the vector of p_j 's is endogenous and determined in equilibrium, but these probabilities also retect the competence of parties' candidates. We now discuss how the ranking of candidates on the list and the popularity of the party go together.

In proposition 3, we saw that a party would place their most competent candidate around the position corresponding to the expected number of seats. Thus, on average, under the conditions of proposition 3, small parties will place their best candidates earlier on their list than more popular parties. For instance, a party that expects to send only one candidate to the parliament will place its best candidate at the top of the list.

The exects of high ot ces discussed above depend on the value of M^{maj} p_j . The condition in proposition 5 is more easily met for higher values of p_j , that is for strong parties that are expected to win a large number of seats in parliament. Indeed, the exects of high ot ces are proportional to the probability that the party wins a majority. Thus, it is in large parties that the exects of high ot ces on incentives play an important role. As in the case analyzed above, electorally strong parties are thus more likely than weak parties to rank candidates in decreasing order of competence.

Media exect also have a dixerent impact depending on the electoral strength of the party. The condition from proposition 6, \mathbf{a}_{m} $\frac{\mathbf{p}_{j}}{m} \mathbf{a}_{m+1}$, depends on the ratio $\frac{\mathbf{p}_{j}}{1-\mathbf{p}_{j}}$ which is increasing in \mathbf{p}_{j} . This means that the media exect needs to be stronger in electoral strong parties.

6 Conclusion

We develop a model of electoral competition between parties under closed list proportional representation. Parties care about competence and incentives. A party orders its candidates

8 Appendix

Proof of proposition 1

Candidate m_j exerts exert to increase the probability he gets elected through an increase in p_j .

The impact of an increase in that candidate m_j 's exort on party j's aggregate exort is:

$$\frac{\mathscr{e}E_{j}}{\mathscr{e}e_{mj}}$$
 a_{m} :

thus, the impact of an increase in e_{mj} on p_j is:

$$\frac{\mathscr{e} \mathbf{p}_{j}}{\mathscr{e} \mathbf{e}_{mj}} \qquad \mathbf{a}_{m} \frac{\mathbf{E}_{-j}}{\mathbf{E}_{-j}} \frac{\mathbf{E}_{-j}}{\mathbf{E}_{j}}^{2} \\
\frac{\mathbf{a}_{m}}{\mathbf{E}_{i}} \mathbf{p}_{j} \qquad \mathbf{p}_{j} :$$

Dixerentiating \mathbf{P}^{k} \mathbf{p}_{j} , we obtain:

$$\frac{dP^{k}}{dp_{j}} \qquad C_{k}^{n} \quad kp_{j}^{k-1} \qquad p_{j}^{n-k} \qquad n \quad k \quad p_{j}^{k} \qquad p_{j}^{n-k-1}$$

$$C_{k}^{n} p_{j}^{k-1} \qquad p_{j}^{n-k-1} \quad k \quad np_{j} \quad :$$

Notice that the sign of the above is not always positive. This can be seen by noting the special case of k. If p_j increases, it is obvious that P^0 p_j is decreasing. As the above formula shows, $\frac{dP}{dp_j} \stackrel{k}{\geq}$ if and only if $k \stackrel{>}{\geq} np_j$.

So we get:

$$\frac{d\boldsymbol{P}^{k}}{d\boldsymbol{e}_{mj}} \qquad \frac{\boldsymbol{a}_{m}}{\boldsymbol{E}_{j}} \boldsymbol{C}_{k}^{n} \boldsymbol{p}_{j}^{k} \qquad \boldsymbol{p}_{j}^{=}$$

We obtain

where a_{n} mj The sign of $_{mj}$ **f** m p_{j} n m

Rewriting the above, we obtain

$$oldsymbol{E}_{j}^{-1}oldsymbol{E}_{-j}^{\oplus oldsymbol{E}_{j}}$$

To ..nish the proof of theorem 2, we consider a comparative static. The parameter corresponds to the increase or decrease in the cost parameter of a candidate. We want to see what happens when we change the cost parameter of one candidate. The direct exect is to change E_1 , but that also changes p_1 ; which leads to further changes in E_1 and E_2 . We want to consider the general equilibrium exect.

Equilibrium is de..ned by:

 $p_1 E_1$
